Abstract There are 272 type specimens of Myxomycetes in the herbarium of the National Science Museum, Tokyo (TNS). Among them, 71 type specimens, including 49 holotypes, 1 lectotype and 21 isotypes, were enumerated.

Keywords: Myxomycetes, TNS, type specimens

The collection of Myxomycetes kept in the herbarium of the National Science Museum, Tokyo (TNS), consists of about 45,000 specimens. Most of these specimens have been preserved in private herbaria of Japanese mycologists, Kumagusu Minakata (1867–1941), Shunsuke Kusano (1874–1962), Shiro Koaze (1875–1951), Yoshikadzu Emoto (1892–1979), the Emperor Showa (1901–1989) and Yukinori Yamamoto (1947–).

In the collection of Myxomycetes, there are 272 type specimens. Among them, 129 specimens have been designated as holotype, isotype and lectotype, and the other 143 specimens are proved to be type (holotype, isotype, syntype, and paratype) according to the literature. However, it is not known if they are preserved in TNS, except for 57 specimens designated as type in Keller *et al.* (1986), Matsumoto & Deguchi (1999), Nannenga-Bremekamp & Yamamoto (1988a, 1988b, 1990a, 1990b), Yamamoto (1987, 1990, 1991, 1992, 1994, 1998, 2000a, 2000b, 2000c, 2000d), and Yamamoto *et al.* (1995). Therefore, the type collection of Myxomycetes in TNS, including typification, will be published in a series of two or three papers.

In the present paper, 71 type specimens, including 49 holotypes, 1 lectotype and 21 isotypes, are enumerated in alphabetical order.
