Abstract: Investigations of deep-sea fauna and anthropogenic pollutants were carried out off the Pacific coast of northern Honshu, Japan during the years 2005 to 2008. An outline of the investigations is given, including characteristics of the study area and methods of collecting and preserving specimens.

Key words: deep-sea fauna, biodiversity, pollutant, Japan.

Introduction

The National Museum of Nature and Science (formerly National Science Museum), Tokyo has been conducting a research project entitled “Study on Deep-Sea Fauna and Conservation of Deep-Sea Ecosystem” since 1993. The purpose of the project is to elucidate the deep-sea fauna around Japan and to trace anthropogenic pollutants in deep-sea animals. The investigations have been carried out in selected areas, and for four years in each area as one term of the project. Previous investigations were carried out in Suruga Bay on the Pacific coast of central Japan in 1993–1996, in Tosa Bay on the Pacific coast of Shikoku Island in 1997–2001, and around Nansei Islands in southwestern Japan in 2002–2005. The results were published in the National Science Museum Monographs (National Science Museum, 1997; Fujita *et al.*, 2001; Hasegawa *et al.*, 2005). Investigations for the fourth term of the project were conducted in the Pacific coast of northern Japan from 2005 to 2008.

The study area is dominated by the cold Oyashio Current, and also affected by the warm Kuroshio Current. This hydrographical environment of the present study area is different from previous ones in this project; the previous three areas are strongly affected by the warm Kuroshio Current. Taxonomic or faunistic surveys in this area were started around the beginning of the last century. Because this area is one of the most important fishing grounds in Japan, the fauna and ecology of fishery resources including pelagic and benthic fishes and crustaceans in this area have been frequently studied by the domestic fisheries research institutions (Kawai, 1955; Okutani and Chinzei, 1976). Those surveys including ones with research vessels such as United States *Albatross*, Russian *Vitjaz*, Japanese *Soyo-maru*, *Hakuho-maru*, and *Tansei-maru* resulted in many papers on deep-sea organisms. However, no comprehensive work for the deep-sea fauna in this area has been available to date. In this research project, deep-sea fauna and anthropogenic pollutants on the continental shelf and slope of the Pacific coast of northern Japan, mainly off Honshu, the main Island of Japan were studied. In this introductory paper, participants, characteristics of the study

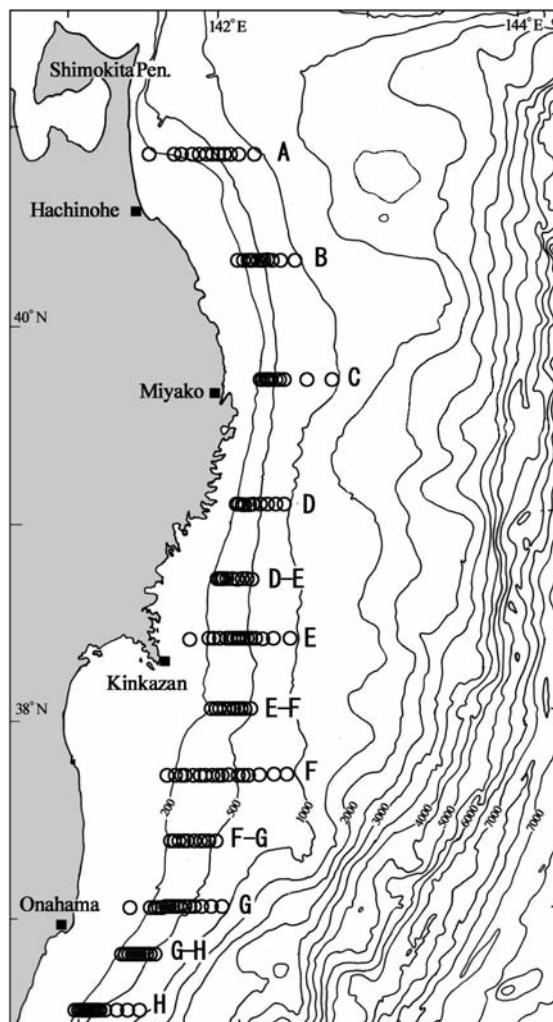

Fig. 1. Survey area and sampling plan of otter trawl stations on 12 transect lines by R/V *Wakataka-maru*.

area, methods of sampling, and treatment of samples are described.

Participants

The present research project was conducted during years 2005–2008 by the Department of Zoology, National Museum of Nature and Science in cooperation with the Tohoku National Fisheries Research Institute, Fisheries Research Agency, and the Department of Environmental Conservation, Ehime University, as well as several taxonomists in various institutions. The participants are: Toshihiko Fujita, Takuma Haga, Kazunori Hasegawa, Minoru Imajima, Utako Iwasaki, Masanori Okanishi, Tsunemi Kubodera, Toshiaki Kuramochi, Keiichi Matsuura, Hiroshi Namikawa, Hiroshi Saito, Gento Shinohara, and Yohko Takata (National Museum of Nature and Science); Kunihiro Fujiwara, Tsutomu Hattori, Masaki Ito, and Yoji Narimatsu (Tohoku National Fisheries Research Institute, Fisheries Research Agency); Tomohiko Isobe, Koji Ohmori, Tomoko Oshiohi, Karri Ramu, Shin Takahashi, and Shinsuke Tanabe (Ehime University); Tadashi Akiyama (Okayama University); Andrey A. Balanov (Russian Academy of Sciences); Kouki Fukuoka (Seikai Na-

tional Fisheries Research Institute, Fisheries Research Agency); Kouichi Kawaguchi (deceased, University of Tokyo); Tomoyuki Komai (Natural History Museum and Institute, Chiba); Masatoshi Moku (National Fisheries University); Koichiro Nakamura (Musashino-shi, Tokyo); Takashi Okutani (Japan Agency for Marine-Earth Science and Technology); Ko Tomikawa (Hiroshima University); Takeo Yamauchi (Toyama Institute of Health).

Survey Area

The main survey area is located between 36° N and 41° N, and the bathymetric range is from 150 m to 3000 m, along the Pacific coast of northern Honshu, Japan (Fig. 1). The ocean floor of this area is quite simple, and isobaths in general run parallel with coast line, and neither large submarine canyons nor large banks are present. The continental shelf is rather narrow; the shelf break lies about 10–30 km from the shoreline, although it lies further, about 50 km off Sendai Bay. The continental slope is gentle to the depth of 1500 m, and then rapidly drops to the Japan Trench, attaining 8300 m. The characteristic feature of the shelf slope area is the presence of various sizes of flat areas, which are scattered throughout the survey area (Iwabuchi, 1985).

This area is bounded by the warm Kuroshio Current and cold Oyashio Current creating complicated water mass distributions and is termed "perturbed area" or the "Kuroshio and Oyashio confluence zone" (Hanawa and Mitsudera, 1987), or the "Kuroshio-Oyashio transition area" (Yasuda, 2003). The heat brought by the Kuroshio Current and the rich nutrient brought by the Oyashio Current make this area productive and one of the most important fishing area in Japan (Yasuda, 2003). The Kuroshio mainly comes from southward, but also from the Tsugaru Strait. The main branch of the Kuroshio, the warm Tsushima Current, flowing northward in the Sea of Japan enters into the studied area through the Tsugaru Strait. This complicated mixed system exists mainly in the surface and subsurface layers, and shows temporal variability. However, the bottom water on the continental shelf slope is dominated by the cold water of the Oyashio origin, or subarctic deep water, with a temperature generally lower than 5°C. The hydrographic structure and variability in this area is reviewed by Yasuda (2003). During the periods of the present survey by R/V *Wakataka-maru*, the bottom temperature varied from 4°C to 13°C in the water shallower than 400 m while, 3°C to 5°C in 400–900 m in most stations (Appendix 1).

Sampling Methods

Three research vessels were employed in this study. The R/V *Wakataka-maru* of Fisheries Research Agency is 57.7 m in length and 692 gross ton (Fig. 2A), the R/V *Tansei-maru* of the Japan Agency for Marine-Earth Science and Technology is 51.2 m in length and 610 gross tons (Fig. 2B), and R/V *Soyo-maru* of the Fisheries Research Agency is 67.5 m in length and 892 gross ton (Fig. 2C). Benthic animals were obtained from depths of 150–2560 m using an otter trawl, two types of beam trawls, a biological dredge, and a baited trap.

Otter trawl

A bottom otter trawl was carried out by the R/V *Wakataka-maru*. The dimensions of the otter trawl net were 41.8 m in length, 7.8 m in width and 3–4 m in height at the mouth, with a span of 22 m between the tips of the side net, which was opened by 2.1 m x 0.9 m rectangular otter boards (Fig. 2D). The stretched mesh size of the main part of the net was 60 mm, with the finer mesh of 8 mm equipped as an outer cover net at the cod end. The ground rope was equipped with steel weights and gum bobbins of 120–150 mm in diameter. A total of 150 sampling stations were set on the 12 latitudinal transect lines (Fig. 1). Occasionally deeper stations at 1200 and 1500 m were set

Fig. 2. Research vessels and gear. A, R/V *Wakataka-maru*; B, R/V *Tansei-maru*; C, R/V *Soyo-maru*; D, otter trawl operation on R/V *Wakataka-maru*; E, 3 m beam trawl; F, 1 m dredge; G, 2 m beam trawl; H, baited traps.

on the lines. The net was usually towed for 30 minutes on the bottom. The dates, gear, positions, depths and bottom temperatures for all stations are shown in Fig. 3 and Appendix 1.

Beam trawls

Two types of beam trawls were used during the cruises of R/Vs *Tansei-maru* and *Soyo-maru*. During two cruises, KT-07-29 and KT-08-27, of *Tansei-maru*, the ORE-type beam trawl of 3 m span was used (Fig. 4, Appendix 2). This trawl bears a pair of steel skids held by a pair of 3 m steel

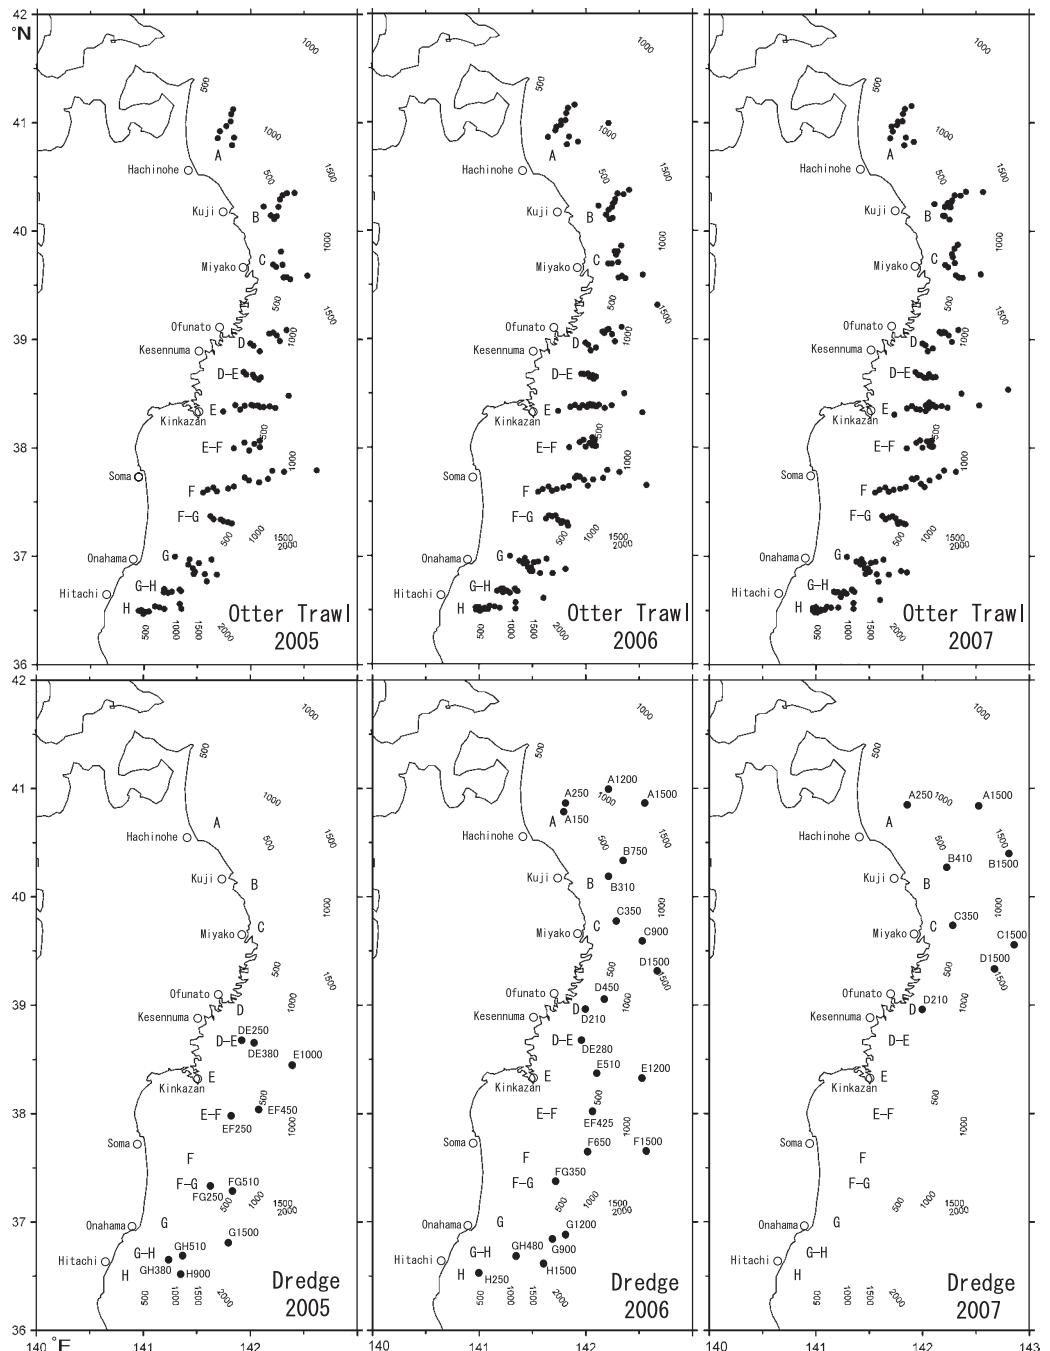

Fig. 3. Sampling sites by R/V Wakataka-maru.

beams at their upper side, with a 10 m-long double layered collecting net attached to the skids (Fig. 2E). The width and height of the fixed opening were 2.8 m and 1 m, respectively. The mesh size of the inner net was 4 mm square at the cod end. The beam trawl was usually towed for 30 minutes on the bottom in each tow. During cruises of R/V *Soyo-maru*, a Sigsbee-Agassiz type beam trawl of 2 m span was used (Fig. 4, Appendix 3). This trawl bears a pair of steel skids held by a pair of

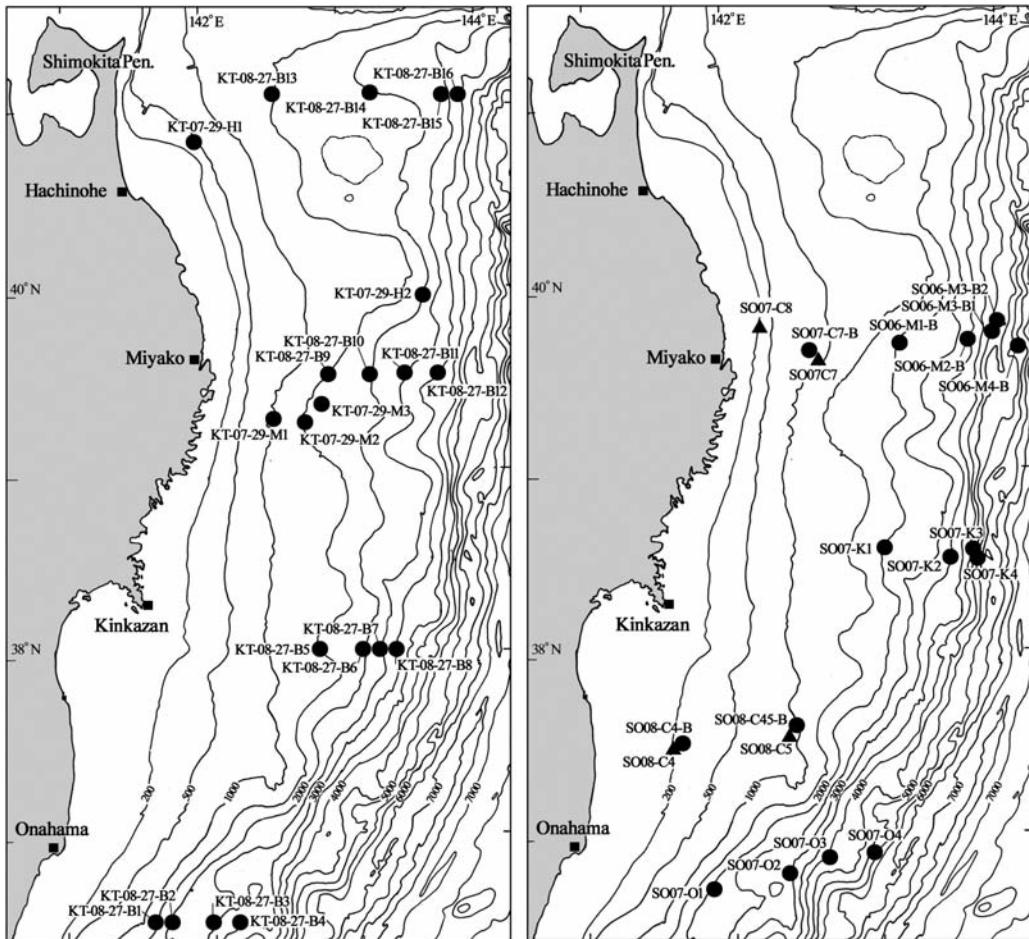

Fig. 4. Sampling sites by R/Vs *Tansei-maru* (left) and *Soyo-maru* (right).

2 m oak wood beams at anterior and posterior parts of the skids (Fig. 2G) and the steel skids are wider in bottom. The width and the height of the fixed opening were 2 m and 0.8 m, respectively. The mesh size of the net was 2 cm throughout. One or two plankton nets with 0.25 mm and 0.5 mm mesh size were occasionally equipped in both beam trawl nets to obtain minute benthic animals.

Dredge

The ORI type biological dredge was used by R/V *Wakataka-maru* (Appendix 1). The dredge was modified from a naturalist dredge (Fig. 2F). The mouth opening was a rectangular steel frame of the following dimensions: 1 m in width, 0.2 m in height and 0.15 m in depth. It had a double-layer collecting net about 1 m long. The outer net is strong, 2 cm in stretched mesh size. The inner net had a fine, 5 mm in square mesh size.

Baited trap

The baited trap was operated by R/V *Soyo-maru* to collect mainly fishes and crabs (Appendix 3). The shape of the trap was truncated cone, made with a steel flame covered by 2 cm mesh net, with three entrance holes on the side (Fig. 2H). The diameter was 1.7 m at bottom and 1.2 m at top, and the height was 1.2 m. Four plastic jars containing cut sardines as bait were placed in each cage. Five baited trap were linked together with ropes, and sunk with anchor weight. A radio buoy was

used to detect the position of the traps. The traps were left for one night on the sea bottom.

Sample Treatment and Depository of Specimens

Contents from each sampling gear were roughly sorted on board. Mesh sieves were used to remove animals from bottom sediments. To collect minute and easily suspended animals, sediment samples were suspended in sea water and screened using a fine net with a mesh size of 0.25 mm. Invertebrates were sorted and fixed by 8–10% neutralized sea water formalin or directly immersed in 99% ethanol depending on taxa and study purposes. Most fish samples as well as specimens used for chemical analysis of pollutants were frozen at –20°C freezer.

The majority of specimens obtained in this survey and used for taxonomic studies are deposited in the National Museum of Nature and Science, but some specimens are deposited with the other institutions of the participants listed above, and these are indicated in papers in this volume.

Summary of the Results

As a result of surveys, the following 17 original papers were contributed to the present volume. In total, 1327 species were reported and one family, two genera and 21 species were described as new to science. Anthropogenic pollutants were analyzed in fish specimens. **Cnidaria:** 1) Namikawa listed 20 species of hydrozoans. **Platyhelminthes:** 2) Kuramochi reported 32 species of parasitic digenetic trematodes from deep-sea fishes. **Annelida:** 3) Imajima recorded 243 polychaetous annelids, including one new family and 14 new species. **Mollusca:** 4) Okutani *et al.* listed 89 species of bivalves and 6 species of scaphopods. 5) Hasegawa reported 177 species of gastropods. 6) Kubodera confirmed occurrences of 84 species of cephalopods. **Arthropoda:** 7) Fukuoka recorded 37 species of lophogastrids and mysids including one new genus and six new species. 8) Tomikawa and Komatsu reported one new species and two rare species of deep-sea amphipods. 9) Yamauchi reported four cymothoid isopods including one new species. 10) Akiyama reported 27 species of cumaceans, including one new species. 11) Komai and Komatsu reported 64 species of dendrobranchiate and caridean shrimps and polychelid lobsters, including two new species. 12) Komatsu and Komai reported 26 species of reptantian decapod crustaceans, including one new species. 13) Nakamura listed nine species of pycnogonids. **Echinodermata:** 14) Fujita *et al.* reported 10 species of ophiuroids of the genus *Ophiura*. **Chordata:** 15) Balanov *et al.* listed 142 species of mesopelagic fishes. 16) Shinohara *et al.* listed 496 species of deep-sea fishes. **Anthropogenic pollutants:** 17) Takahashi *et al.* analyzed persistent organohalogen compounds contained in deep-sea fishes.

Acknowledgements

We wish to express our sincere thanks to the crews of the R/Vs *Wakataka-maru*, *Tansei-maru*, and *Soyo-maru* for their collaboration in the field work. For the R/V *Soyo-maru* cruises, Drs. Masayuki Minakawa, Takami Morita and Ken Fujimoto of the National Research Institute of Fisheries Science, Fisheries Research Agency, kindly gave us the opportunities for the sampling during their cruise for the Marine Environmental Radioactivity Research. Thanks are also due to Dr. Hugo Shimizu of the Tohoku National Fisheries Research Institute, Fisheries Research Agency, for valuable information on hydrographic structure of the survey area and Dr. Chris Harvey-Clark, University of British Columbia, for review of the manuscript.
